TO WHOM IT MAY CONCERN

This is to confirm, that MAREL Serwis company sent the best offer and was responsible for supply and development of the laboratory test facility, being a part of the "Green Energy" project.

Jobs performed by MAREL Serwis covered implementation of the system, that enables to simulate conditions and monitor various parameters of parallel work of different power sources in one power grid. That includes:

- Making the whole electrical installation connecting the generators with the main switchboard
- Development of the software, featuring the ability to monitor all the important network parameters
- Supply of all the parts for the main switchboard generator sections

The Szczecin Marine Academy is fully satisfied with the quality of job done by engineers working for MAREL Serwis. They proved to be flexible and innovative in the way of thinking, which is not to be underestimated in development of joint science-business projects. We would be happy to have an opportunity to collaborate in any future projects.
